1 Test.All

First text line

```
module Test.All where

import Test
import Test.Sub.Base

-- Just testing...
```

Literate prose is included in generated webpages and PDFs. It is generally rendered as plain text:

- * Blank lines produce paragraph breaks, but line breaks and indentation are otherwise ignored.
- * URLs do not become links.
- * Characters treated as special by LaTeX lead to errors when generating PDFs.
- * Use of Unicode characters in generated PDFs may require mapping them to LaTeX markup.

The subset of LaTeX math markup supported by KaTeX (<https://katex.org>) is rendered correctly in webpages and PDFs. The following examples are from the Material for MkDocs website:

$$\cos x = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^{2k}$$

The homomorphism f is injective if and only if its kernel is only the singleton set e_G , because otherwise $\exists a, b \in G$ with $a \neq b$ such that $f(a) = f(b)$.

```
-- More code
```

Last text line

2 Test.Sub.Base

```
module Test.Sub.Base where
```

This module is imported by Test.All, and should be included in the website generated from Test.All.

3 Test

Copied from examples/syntax/highlighting/Test3.lagda in the agda/agda repository, with additional literate prose by @pdmosses

This test file currently lacks module-related stuff.

And interesting uses of shadowing.

```
module Test where

infix 12 _!
infixl 7 _+_ _- _
infixr 2 -_

data N : Set where
  zero : N
  suc : N → N
```

The type Set is declared in the built-in module Agda.Primitive.

```
_+ _ : N → N → N
zero + n = n
suc m + n = suc (m + n)

postulate _- _ : N → N → N

- _ : N → N
- n = n

_! : N → N
zero ! = suc zero
suc n ! = n - n !
