## 2 Test.Sub.Base

```
module Test.Sub.Base where
```

This module is imported by Test.index, and should be included in the website generated from Test.index.

## 3 Test.index

First text line

```
module Test.index where

import Test
import Test2
-- import Test3
import Test.Sub.Base

-- Just testing...
```

Literate prose is included in generated webpages and PDFs. It is generally rendered as plain text:

- \* Blank lines produce paragraph breaks, but line breaks and indentation are otherwise ignored.
- \* URLs do not become links.
- \* Characters treated as special by LaTeX lead to errors when generating PDFs.
- \* Use of Unicode characters in generated PDFs may require mapping them to LaTeX markup.

The subset of LaTeX math markup supported by KaTeX (<https://katex.org>) is rendered correctly in webpages and PDFs. The following examples are from the Material for MkDocs website:

$$\cos x = \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^{2k}$$

The homomorphism  $f$  is injective if and only if its kernel is only the singleton set  $e_G$ , because otherwise  $\exists a, b \in G$  with  $a \neq b$  such that  $f(a) = f(b)$ .

-- More code

## 4 Test2

```
module Test2 where
open import Test

-- Testing the inter-file goto facility.

test : ℕ
test = 12 + 34 + 56

-- Testing qualified names.

Eq = Test.Equiv {Test.ℕ}
```
